## INTERESTS

Kathleen M. Carley's research involves applying computational social science, cognitive science, organization science, dynamic network analysis, social network analysis, machine learning, data analytics and text analytics to complex social and organizational problems such as social cybersecurity, disinformation, disease contagion, disaster response, and terrorism. She develops social and dynamic network analytical and visual techniques, agent-based models, network-based text mining and machine learning tools, all predicated on blending socio-cognitive theory with advanced computation. She and members of her center have developed novel tools and technologies for analyzing large-scale geo-centric dynamic-networks and various multi-agent simulation systems. These tools include ORA which is a statistical and graphical toolkit for analyzing and visualizing multi-dimensional networks, social networks, dynamic-networks, geo-spatial networks with special features for social media analytics; NetMapper and AutoMap which are text-mining systems for extracting semantic networks from texts and then cross-classifying them using an organizational ontology into the underlying social, knowledge, resource, and task networks, as well as sentiment. Her simulation models meld agent-based technology with network dynamics and empirical data. For example, BioWar is a city-scale dynamic-network agent-based model for understanding the spread of disease and illness due to natural epidemics, chemical spills and weaponized biological attacks; and Construct is an agent-based dynamic-network model for assessing network evolution and the diffusion of information and beliefs under diverse socio-demographic and media environments. Dr. Carley is the director of the center for Computational Analysis of Social and Organizational Systems (CASOS) and the center for Informed Democracy and Social-Cybersecurity (IDeaS). She is the founding co-editor of the journal Computational Organization Theory and has co-edited several books in the computational organizations and dynamic network area. She has led multiple applied projects, e.g., identifying disinformation aimed at at-risk populations in SW PA that was used by the public health groups, OMEN a train as you play system for recognizing, detecting and learning how to respond to online harms, and her work on insider threat. Many of the algorithms and tools she has led the development of are now in use in corporations and the military. Her work has led to changes in doctrine in the US military, to new courses at various universities, and to new funding priorities in US research sponsors.
