- *Introduction of semiconductor Quantum dots*
- *Quantum Dot / Conducting Polymer Hybrid Material*
- *Light-Emitting Diodes Based on QD-Polymer Hybrid Materials*
- *Summary*

# Nanoparticle applications

- **Quantum dots**

- QDLEDs
- Solar cells
- Biomedicine

- **Magnetic nanoparticles**

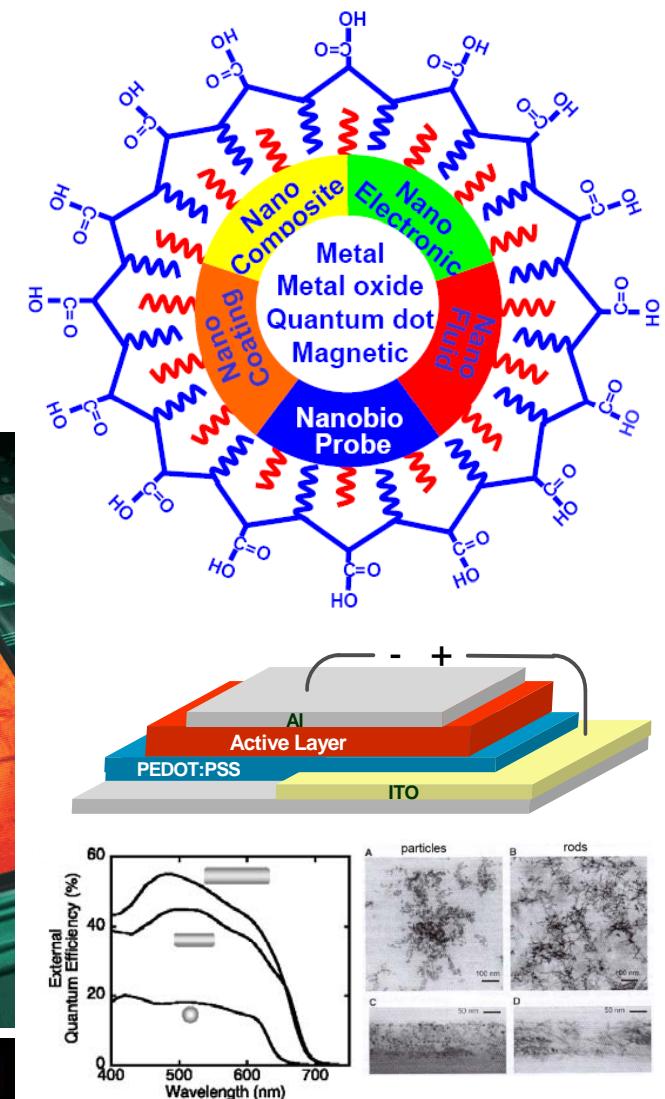

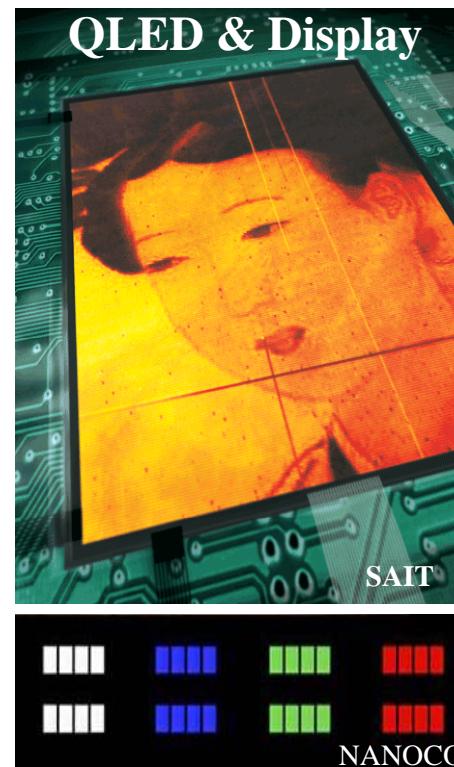

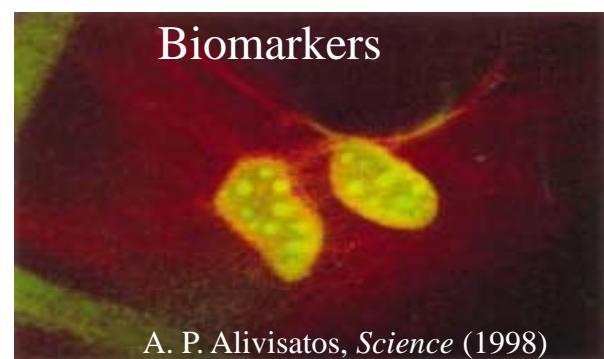

- Biomedicine: MRI, Hyperthermia, Drug delivery

- **Metal nanoparticles**

- Biodetection (Au, Ag)
- Electromagnetic shell (Fe, Ni, Co)
- Nanofluid

- **Metal oxide nanoparticles**

- Dielectrics
- Nanocomposite
- Nanocoating

# Comparison of QD-LED and OLED

Korea-US NanoForum 2010  
ECC, Ewha Univ., Korea  
2010. 4. 5-6

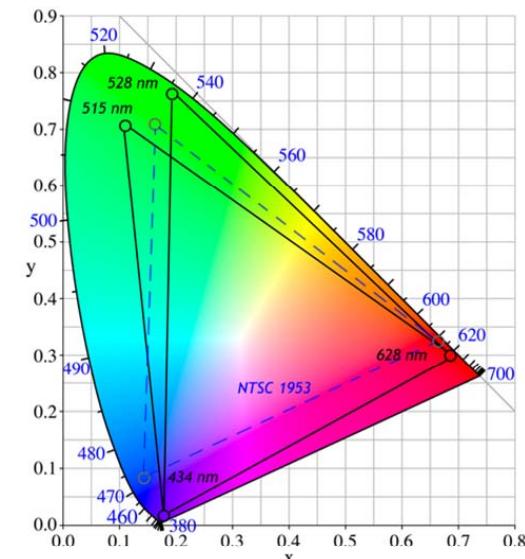

Feature	QD-LED	OLED
Efficiency	Low	High
Emission bandwidth (color saturation)	Narrow FWHM<30nm	Broad FWHM<50-100 nm
Color Tunability	Excellent: Change QD size	Low: Different emitter
Cost of Emitter	Low: One procedure for all RGB emitters	High
Manufacturing process	Solution-based	Vacuum deposition Solution-based
Large display area	Yes	Yes
Flexibility	Yes	Yes

J. H. Kwak, Ph.D. Thesis (SNU, 2010)

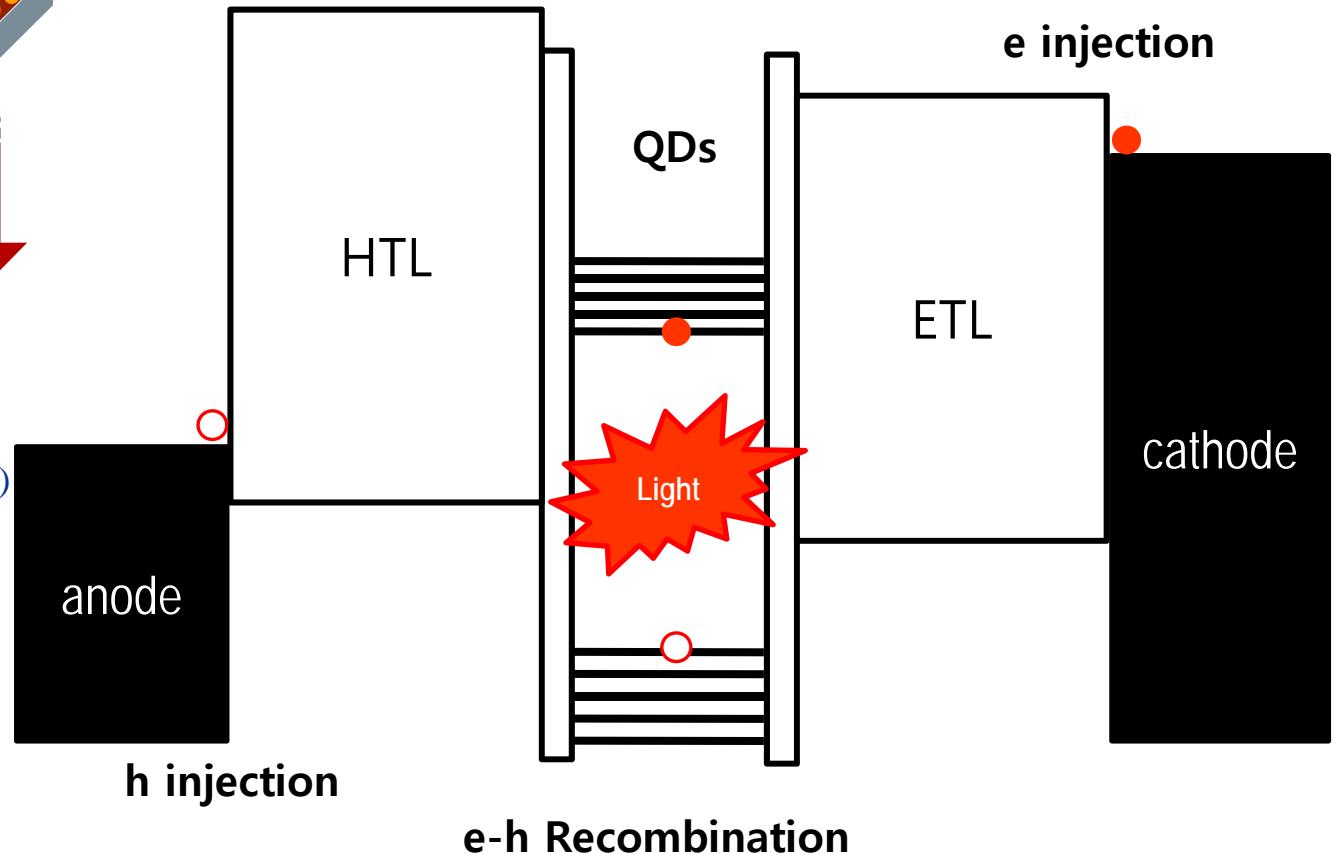

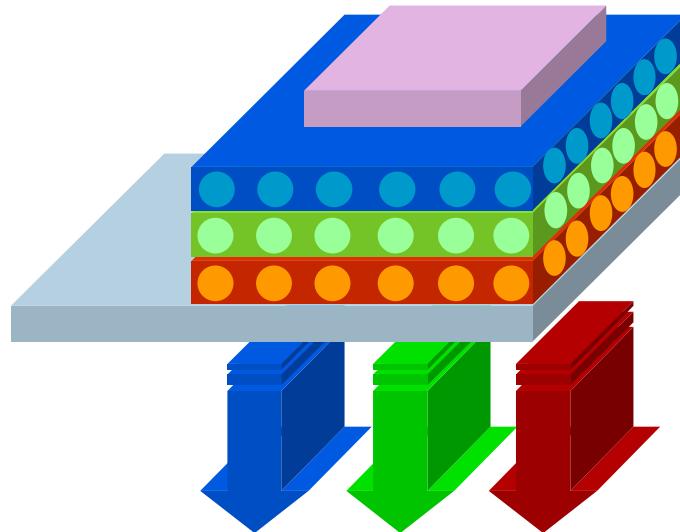

J. H. Kwak, Ph.D. Thesis (SNU, 2010)

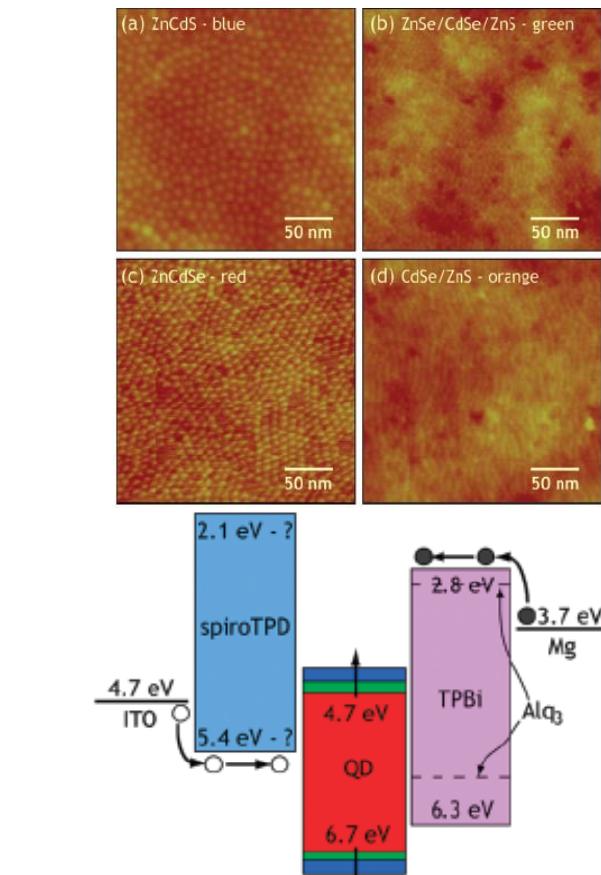

J. H. Kwak et al., SID 2010

## QD-LEDs

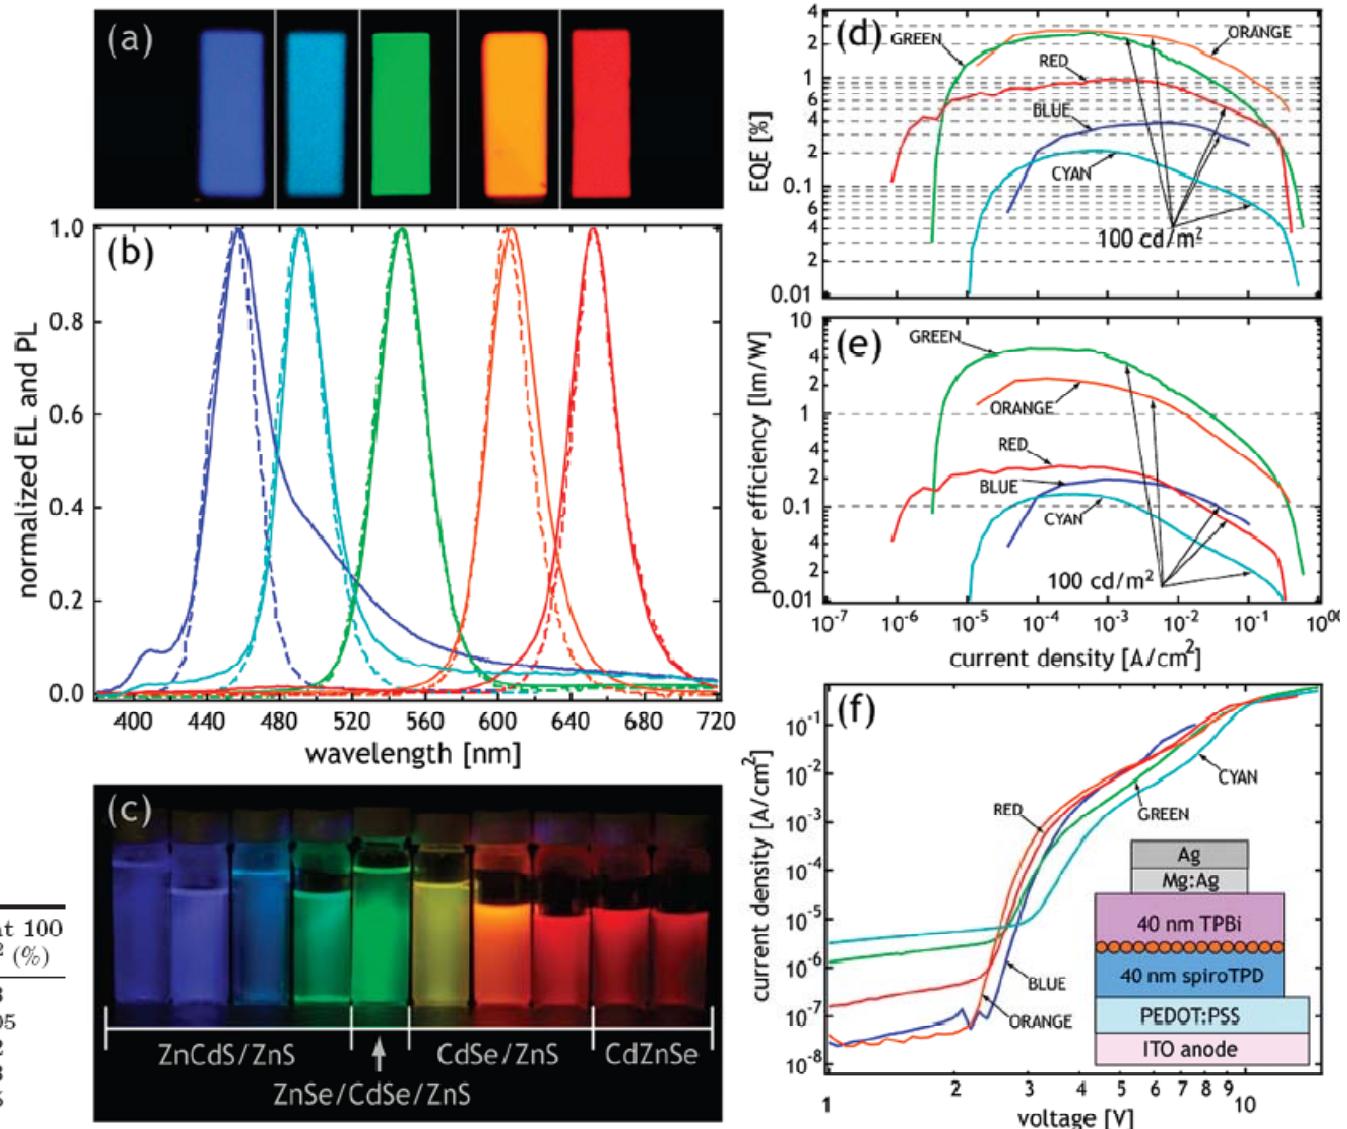

- Size-tunable band-gaps (Color tunability)
- High PL quantum efficiency
- Good photostability
- Narrow emission line widths (FWHM <30 nm)
- Compatibility with solution processing methods

# QD LEDs Tunable over the Entire Visible Spectrum

QD-LED color	peak EQE (%)	brightness at peak EQE ( $\text{cd}/\text{m}^2$ )	EQE at 100 $\text{cd}/\text{m}^2$ (%)
blue (EL <sub>max</sub> at 460 nm)	0.4	15	0.3
cyan (EL <sub>max</sub> at 490 nm)	0.2	3	0.05
green (EL <sub>max</sub> at 545 nm)	2.6	28	2.2
orange (EL <sub>max</sub> at 600 nm)	2.7	13	2.3
red (EL <sub>max</sub> at 650 nm)	1.0	7	0.5

# Problems for low efficiency of colloidal QD-LEDs

Korea-US NanoForum 2010  
ECC, Ewha Univ., Korea  
2010. 4. 5-6

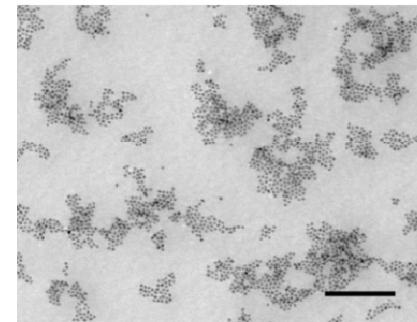

**Poor charge carrier injection** because

- 1) QDs generally have **an inorganic shell of a wide bandgap material** (e.g., CdS or ZnS) to increase photostability and improve emission quantum yields by passivating surface defects.
- 2) QDs are covered by **a layer of organic ligands**, which is needed during their growth and provides solubility in organic solvents to allow processing. However, these organic and inorganic layers form a tunneling barrier for charge injection.
- 3) The valence bands of the QDs are generally shifted to lower energy compared to the highest occupied molecular orbital (HOMO) levels of commonly used organic hole-injection layers. This introduces **significant energy barriers to hole injection**.
- 4) Massive QD aggregation occurs in blend film of QDs and polymers → **Poor morphology**

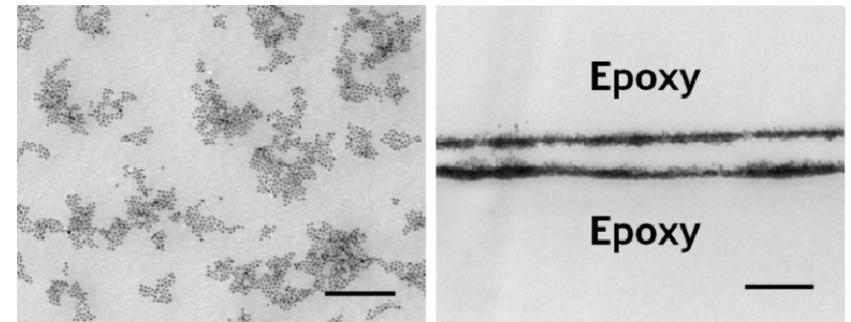

- Wide energy band gap shell
- Organic ligands
- Surface traps

## Nanoparticle

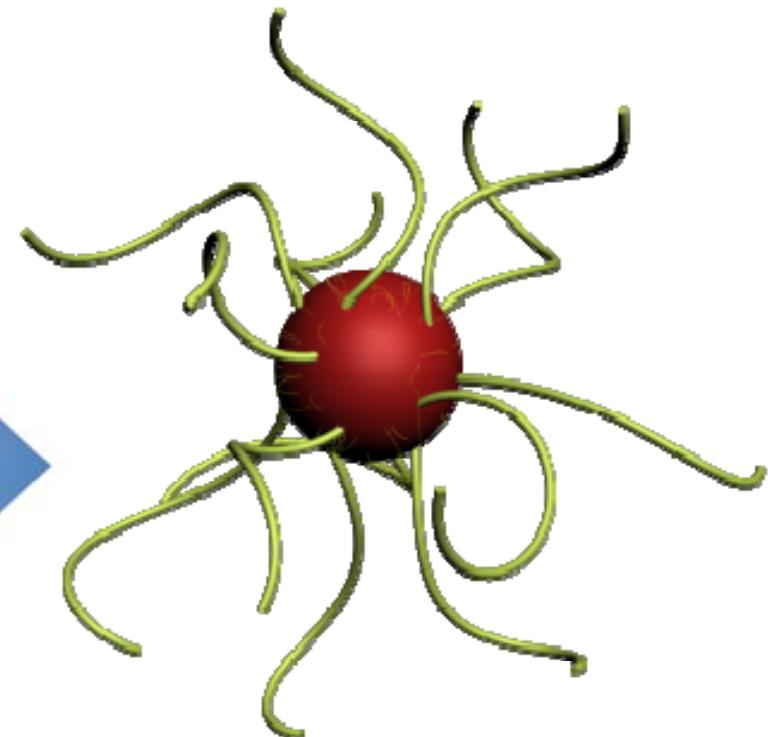

- High extinction coefficient
- High electron mobility
- Band gap & position tunability
- Solution process capability

## Polymer

- High extinction coefficient
- High hole mobility
- Solution process capability
- Patterning capability
- Synthesis thru *RAFT, ATRP, NMP*

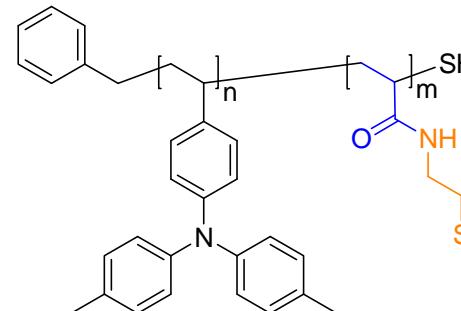

## Conducting Polymer/NP Hybrid

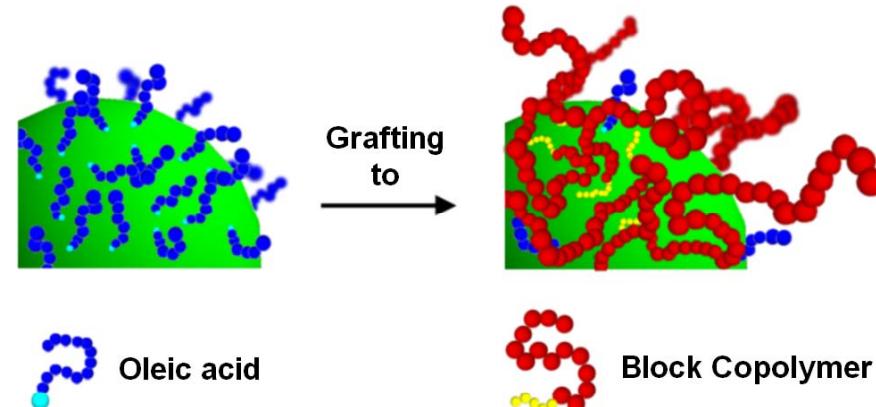

- High extinction coefficient
- Efficient charge separation
- Improved colloidal stability
- Solution process capability
- Patterning capability

# Comparison of QD/Polymer Hybrid and Blend

Korea-US NanoForum 2010  
ECC, Ewha Univ., Korea  
2010. 4. 5-6

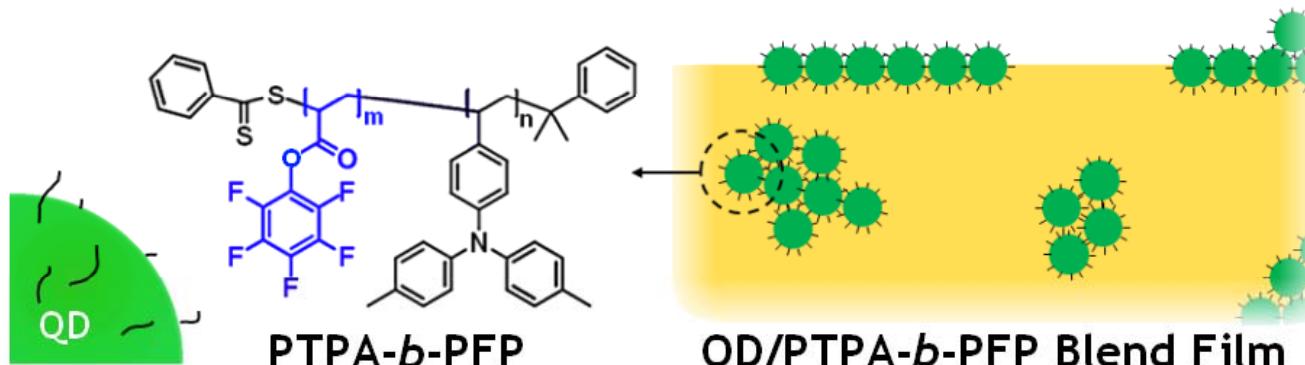

- Quantum Dot / Conducting Polymer **Hybrids**

\* poly(*para* methyl triphenylamine-*b*-cysteamine acrylamide)

The thiol anchor groups in the CAA block replace the surface ligands (oleic acid) of QDs, leading to QD/conducting polymer **hybrid** films.

- Quantum Dot / Conducting Polymer **Blends**

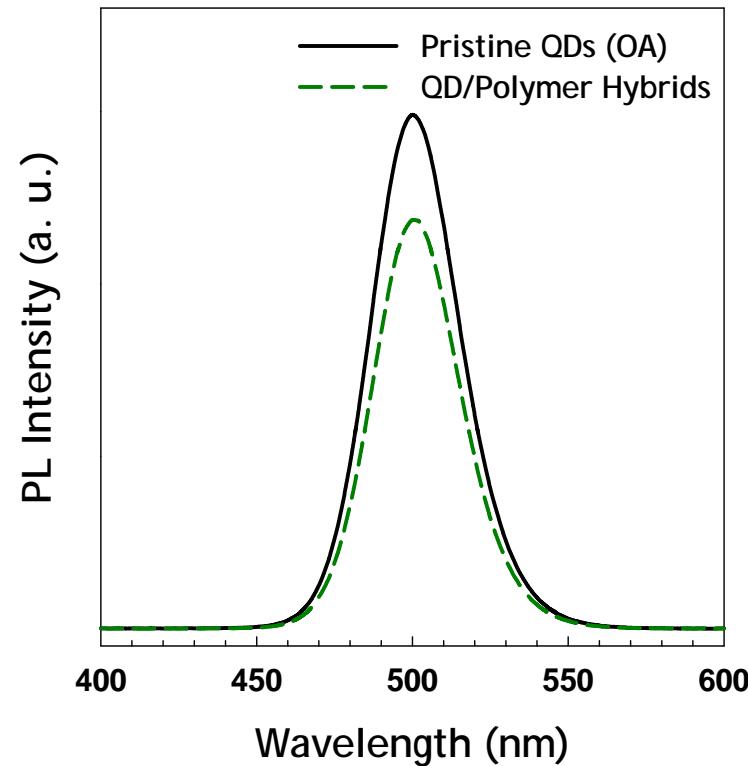

\* poly(*para* methyl triphenylamine-*b*-pentafluorophenone)

The fluorinated block (PFP) with low surface energy does not have specific interactions with QDs, resulting in QD/conducting polymer **blend** films.

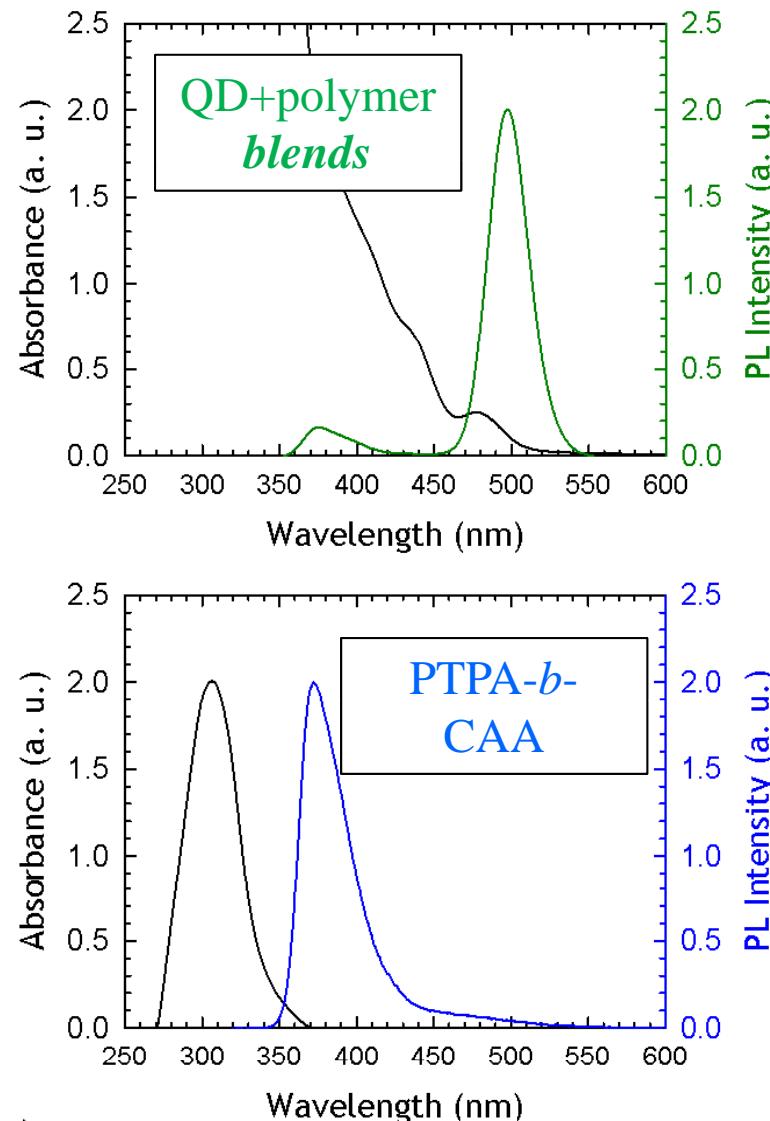

Jeonghun Kwak, Wan Ki Bae, Matthias Zorn, Heeje Woo, Hyunsik Yoon, Jaehoon Lim, Sang Wook Kang, Stefan Weber, Hans-Jürgen Butt, Rudolf Zentel, Seonghoon Lee, Kookheon Char, Changhee Lee, Adv. Mater. **21** (48), 5022 (2009)

# Comparison of QD/Polymer Hybrid and Blend

- Quantum Dot / Conducting Polymer Hybrid Material

- *QD/conducting polymer hybrid* materials have been prepared by grafting conducting polymer with anchor group.
- *Hybrid films* show improved surface/bulk morphology and stability compared to QD/conducting polymer *composite films*.

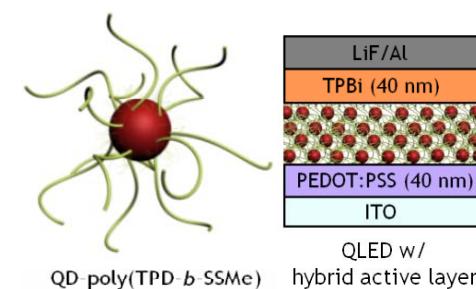

- Light-Emitting Diodes Based on QD-Polymer Hybrid Materials

- *reduced turn-on voltage, high efficiency, reduced efficiency roll-off and high color purity.*

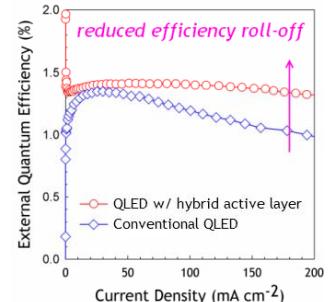

- Compatible with *conventional solution/patterning process* and **Applicable** to another *optoelectronic devices such as solar cells, photodiodes, etc.*
